XRPL HACKATHON 2026 · TEAM DARK MODE

Borneo

Publish once. Any AI agent can shop you.
Get paid in RLUSD on the XRP Ledger.

Ariel Ong · Sumit Sanjay Shinde

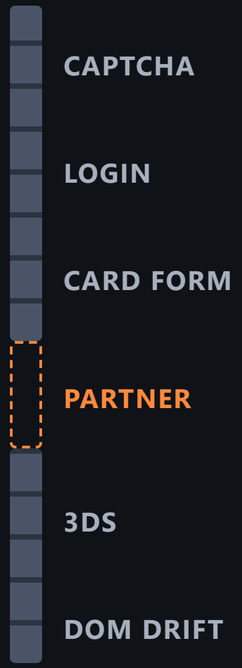

XRPL · Mastercard · QuickNode · Ledger

THE PROBLEM · MERCHANT SIDE

Agents can’t shop your store

Your customers are becoming agents. Your store was built for humans.

Your store

HTML pages

Cart → login → card

Built for human eyes

Turned away **0** · Got through **0** only via a partner chat app

THE PROBLEM · MERCHANT SIDE

Three ways the merchant loses

01

Invisible

Agent reach is rented from two chat apps. Every other agent gets turned away.

Even top agents finish only about 70% of WebArena web tasks.

02

Unpaid

Checkout needs a human: login, saved card, 3DS. An agent can’t pay on its own.

Cross-border card payouts add fees and days of delay.

03

Exposed

Product text is untrusted. One poisoned listing can change who gets paid.

Prompt injection is #1 on the OWASP Top 10 for LLM apps.

THE SOLUTION

Talk. Publish. Get paid.

STEP 1

Talk

Tell the setup agent what you sell, or drop a CSV or your store URL.

STEP 2

Publish

You go live on an open registry. Any HTTP agent can find you.

STEP 3

Get paid

Buyers pay in RLUSD, XRP or Mastercard. You always get RLUSD.

About 5 minutes. No code, no dashboard, no new checkout to build.

LIVE DEMO

Two sides, one network

Merchant

1. Chat, drop a CSV or paste a URL
`/onboard`

2. Connect Ledger, enable RLUSD
`/merchant/setup`

3. Publish to the open registry
`/registry.json · /s/{slug}/llms.txt`

Buyer agent

1. “Linen shirt under 40 RLUSD”
`/buyer`

2. Searches every store, ranks SKUs
`GET /api/search?q=…`

3. Authorize, settle, explorer receipt
`POST /s/{slug}/buy → 402`

HOW IT WORKS

From catalog to settled RLUSD

Locked quote

`{ storeSlug, skuId, price, payTo }`

The pay path only sees these four fields. Product text can’t change who gets paid or how much.

Verified sellers

`XLS-70 credential + XLS-40 DID`

Any agent can check a seller on any XRPL node, without trusting Borneo.

BUILT ON THE XRP LEDGER

Four XRPL features, all live on testnet

RLUSD · x402

Pay-per-request checkout

HTTP 402 challenge, agent pays the exact RLUSD quote, receipt on-ledger.

AMM · cross-currency Payment

Pay in XRP, receive RLUSD

One Payment with SendMax in XRP and Amount in RLUSD, routed through the AMM.

XLS-70 · XLS-40

Verified sellers

BorneoVerifiedSeller credential and a DID document. Search ranks verified sellers higher.

Trust lines · TrustSet

RLUSD-ready payouts

A store only publishes once its payTo has an RLUSD trust line, signed on a Ledger.

CHECKOUT

Three ways to pay, one way to get paid

RLUSD via x402

Agent answers the HTTP 402 challenge and pays the exact RLUSD quote on XRPL.

XRP, auto-converted

One cross-currency Payment through the XRPL AMM: buyer spends XRP, merchant receives RLUSD.

Mastercard Agent Pay (AP4M)

Agent pays from a capped AP4M payment channel on XRPL EVM; each purchase redeems a voucher.

MERCHANT RECEIVES

RLUSD

Like a tourist card terminal: the buyer picks the currency, the merchant’s books stay in one.

LEDGER · NO SEED IN .ENV

Merchant payouts land on a Ledger

1 Connect

Derive the merchant’s r-address on the device. Keys never leave it.

2 Fund

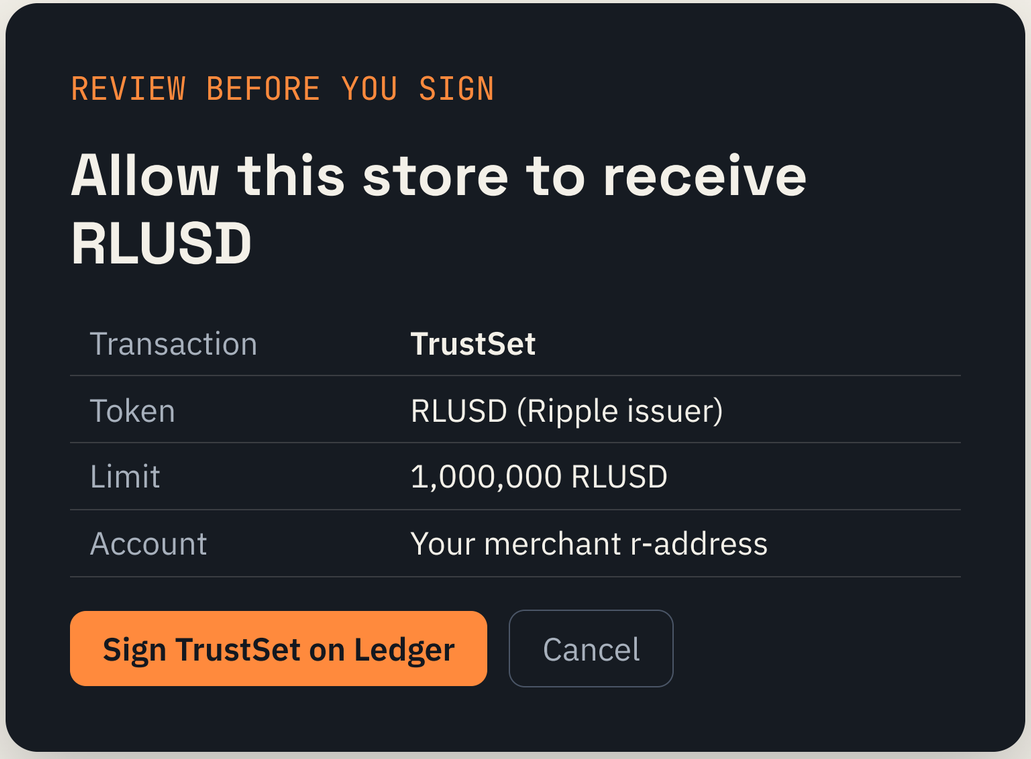

Testnet faucet covers the XRP reserve.

3 Enable RLUSD

TrustSet signed on-device, after a plain-English preview.

4 Bind

That address becomes the store’s payTo. Agent payments land there.

SPONSOR STACK

Where each sponsor sits

Ripple · XRPL

Settlement and trust. RLUSD, x402, AMM payments, XLS-70 credentials, XLS-40 DIDs.

Mastercard

A buyer rail. AP4M channels: open once with a cap, buy, redeem a voucher per purchase.

QuickNode

The pipe to the ledger. Dedicated XRPL RPC and WebSocket for every settle, AMM quote, credential check and TrustSet.

Ledger

The merchant’s keys. Payout address held in hardware, with clear signing for TrustSet.

MASTERCARD · AP4M DEEP DIVE

Give agents a budget, not a card number

Capped

The buyer’s agent opens one payment channel with a hard RLUSD cap. It can never spend past it.

Accountable

The agent signs in with a registered wallet and pays a known merchant ID. Every spend is attributable.

Instant

Each purchase redeems a voucher in RLUSD on XRPL EVM. No per-purchase card authorization round trip.

> For Borneo merchants: Mastercard-backed agent payments, zero extra integration.
>
> Same locked quote as every other rail. The merchant doesn’t change a thing.

MASTERCARD · HOW WE BUILT IT

One purchase on the AP4M rail

1 · once
Sign in
Agent wallet gets an AP4M session

→

2 · once
Open channel
RLUSD cap + merchant ID

→

3 · per buy
Authorize
Buyer approves the locked quote in chat

→

4 · per buy
Redeem
Voucher for redeemed + price

→

5 · per buy
Receipt
Claim ID + XRPL EVM tx link

Cap check first

Over-cap buys are refused before anything is signed, with the remaining balance shown.

No double pay

Each order is idempotent: a retry returns the same receipt instead of redeeming twice.

Open channels only

Channel state is read on-chain before every redeem. Closed or expired means no settle.

POST /api/ap4m-settle · src/lib/ap4m/settle.ts · AP4M hackathon SDK + ethers on XRPL EVM Testnet

QUICKNODE DEEP DIVE

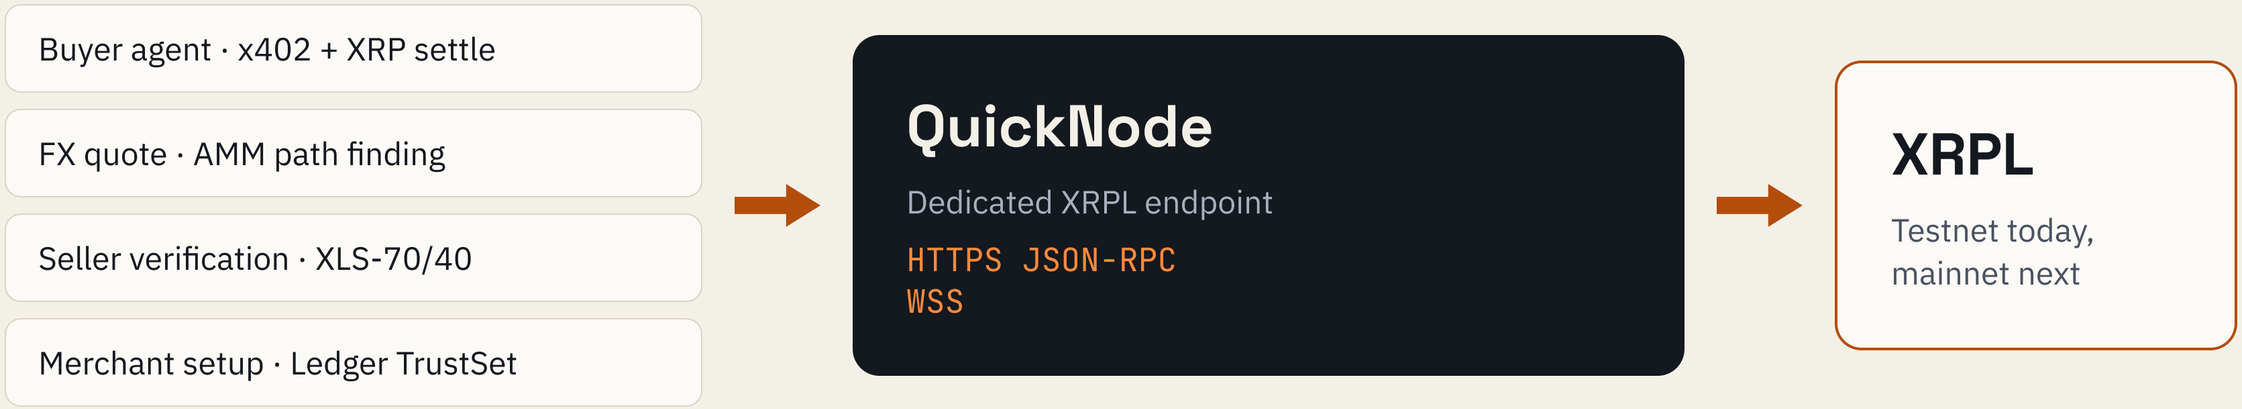

Checkout is only as reliable as the node

One agent purchase hits the XRP Ledger several times. If any call stalls, the agent’s checkout stalls with it.

Stage	XRPL call through QuickNode	Transport
Verify seller	Credential + DID lookup on the seller’s account	JSON-RPC
Check payTo	account_lines: does it hold an RLUSD trust line?	WebSocket
Quote XRP → RLUSD	amm_info + ripple_path_find	WebSocket
Settle	Payment submit, wait for validation	WebSocket
Onboard merchant	Submit the Ledger-signed TrustSet	WebSocket

QUICKNODE · HOW WE BUILT IT

One dedicated endpoint behind every rail

Not shared

No public-node rate limits or queueing in the middle of a checkout.

Answer in one turn

WebSocket submit-and-wait returns a validated result inside the same chat turn.

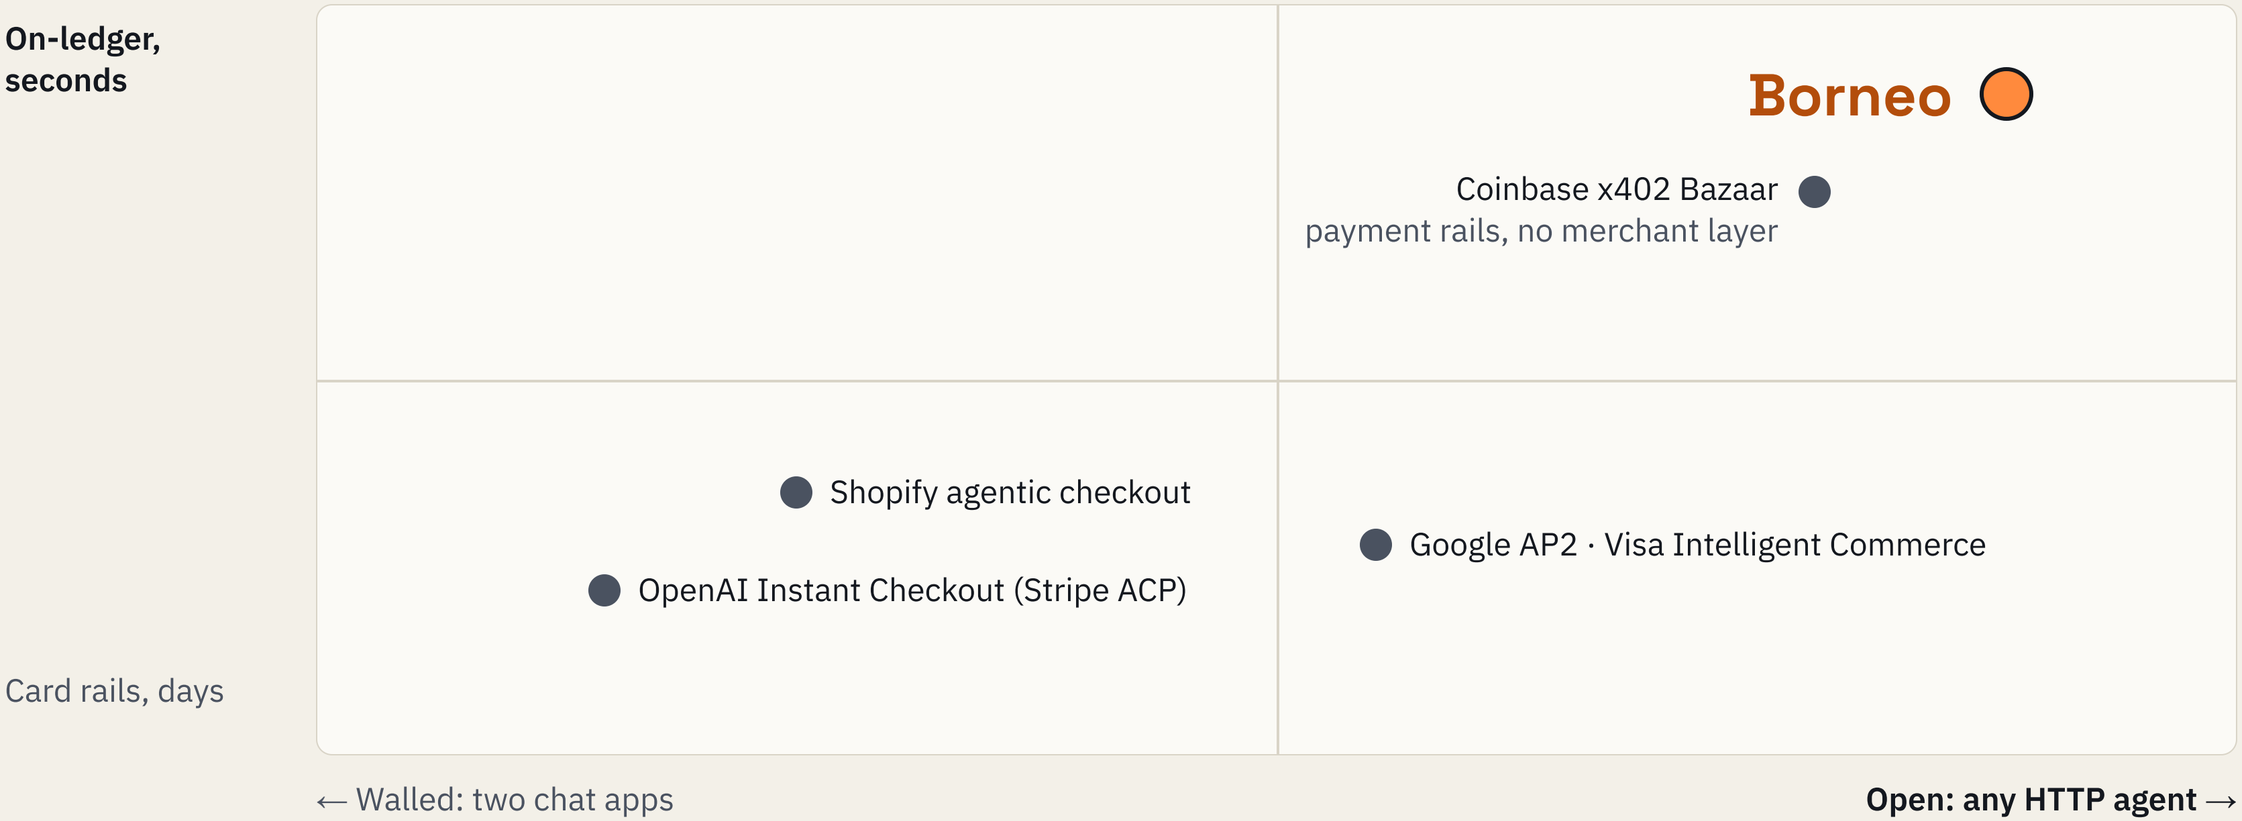

Config, not code

Two env vars point every service at it. Mainnet is a swap, not a rewrite.

`XRPL_RPC_URL · XRPL_WS_URL → src/lib/config.ts · xrpl.js Client + fetch JSON-RPC`

COMPETITION

Open reach and instant settlement

Placement is our reading of each product’s public announcements.

POTENTIAL

The market, and how we earn

$1.5T

Projected agentic commerce by 2030, up from $8B in 2026.

Source: Juniper Research forecast

Start: cross-border SMB fashion in Southeast Asia

Then: B2B procurement agents

Then: any vertical with a catalog

Take rate
1% of settled volume, vs ~3% for cards

Verified seller
$99 / year for the on-ledger credential

Promoted ranking
Boosted placement in registry search

ROADMAP

Built this weekend, and what's next

Built

- Open registry, llms.txt, search API
- RLUSD x402 and XRP→RLUSD via AMM
- Verified sellers (XLS-70, XLS-40)
- Mastercard AP4M rail
- QuickNode dedicated endpoint
- Ledger payTo + clear signing

Next

- RLUSD on XRPL mainnet
- Physical Ledger Nano over WebHID
- Verticals beyond fashion
- Merchant payout dashboard

Later

- B2B procurement agents with company spend policies
- Hardware signing for buyers too
- Publish the storefront protocol as an open spec

BORNEO · TEAM DARK MODE

Every merchant should be findable by every agent.
